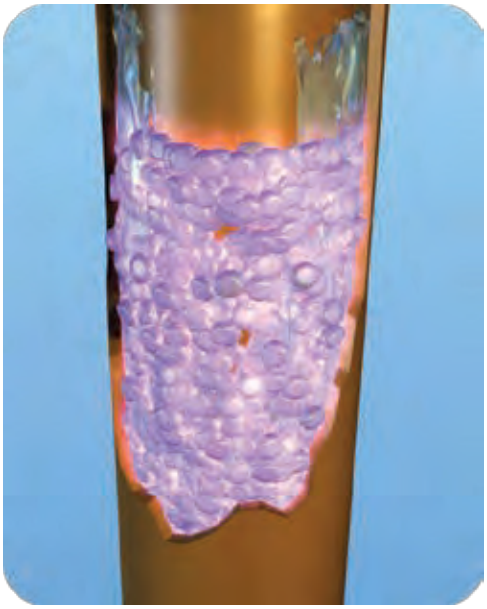
UV Light Sources with IST Plasma-shells™



Plasma-shell™ lighting elements provide large area, homogenous UV lighting for:

Disinfecting and germicidal applications
Photo-curing
Medical treatment
UV band communication

The tiny light emitting elements are placed onto substrates to form large arrays of distributed light. The elements can be tightly packed to form a low-cost, continuous, and completely diffuse light source without concern of heat build up.

Plasma-shells™ are voltage controlled, so the power source can be remote from the array allowing for an array depth of less than 4mm.

UV Plasma-shells™ are available in UV-A (400 – 315 nm), UV-B (315 - 280 nm), and UV-C (280 - 200 nm). Arrays can be made to any size.

UV Plasma-shell™ Features:

- Flexible packaging
- Conformable
- Scalable to very large areas
- Low profile (4mm depth)
- Environmentally friendly (no mercury)
- Highly diffuse
- High surface area
- Low cost
- Typical life is 60,000 hours
- Hydrostatic crush strength > 15 Ksi
- Impact resistant to 750 lbs / sq inch
- Temperature resistant >1000° C

BENEFITS OF PLASMA

Plasma-shellsTM produce a homogenous light source with no hot spots. This is a green technology fabricated using a low cost environmentally friendly process that does not use mercury.

ULTRA RUGGED

Unlike most lighting technology, the Plasma-shellTM light source is ultra rugged. It is resistant to shock, vibration, temperature extremes, pressure extremes, and harsh chemical environments.

ADAPTIVE DESIGN

The Plasma-shellsTM can be applied to rigid or flexible surfaces. They can be tiled to fit any size, shape, or form factor.

Plasma-shell™ Technology

Plasma-shells™ are hollow gas encapsulating devices developed by Imaging Systems Technology (IST). When a voltage is applied across the walls of the shell, the encapsulated gas is energized into plasma. The Plasma-shells™ are electronic components that can be used as light emitters, switches, and sensors. Under a sister company, Deep Springs Technology (DST), hollow shells are being introduced into mechanical and structural applications including armor, buoyancy, and heat shielding.

Current Plasma-shell™ Applications

IST is introducing the Plasma-shell™ components into a number of electronic markets including: germicidal, photo curing, lighting, displays, nuclear, and RF. Applications and products are listed below.

Plasma-Switched Frequency Selective Surface (PS-FSS)
Plasma-shell™ switches activate and deactivate electromagnetic aperture with fast response time for HPM/EMP shielding and low observable applications.

RF-Alert™ Sensor
Plasma-shell™ sensors are employed to provide a passive, low cost, RF monitoring system for personal safety. Applied to clothing, gear, or other surfaces, these devices can be used in industrial, military, or scientific settings.

IST Plasma-shell™ Display
Plasma-shell™ pixels are formed into low cost, rugged, large area arrays for use in large area digital signage, simulation, and scene generation.

IST Plasma-shell™ Light Tiles
Plasma-shell™ lighting elements offer a customizable, low profile, ultra rugged light source for decorative, architectural, and industrial applications.

UV Light Source
Plasma-shell™ lighting elements provide large area, homogenous lighting for germicidal, photo-curing, medical treatment, and UV band communication.

FABRICATION CAPABILITIES

Our Plasma-shell™ manufacturing process has many customizable parameters. Tight control over our process allows IST to produce shells to the specification of a wide variety of applications.

Controllable Parameters	Notes
Sizes	IST fabricates shells from 0.5 mm to 10 mm. Other sizes are possible. Typical applications call for sizes of 1- 4 mm
Wall thickness	Wall thickness is controllable. Typical applications call for wall thickness of 5 to 10 percent of shell diameter
Shapes	Practically any shape is poss ble. Typical shapes include cylinders, cubes, oblate spheroids, rectangular prisms, and other complex shapes
Materials	Glass, Metal, Ceramic. Typical materials include Y_2O_3, ZrO, SiO_2, Al_2O_3, maraging steel, carbon steel, and various glasses
Layers	Shells can be fabricated with layered walls
Gas Fill	Inert gas, including mixtures with hydrogen up to 4%
Gas Pressure	0 – 500 Torr
Post Processing Capabilities	Coating, electroding, and application of shells onto substrates

TECHNICAL SUPPORT

IST provides world class customer service to support our cutting edge technology.

QUALITY ASSURANCE

IST is an ISO 9001:2008 certified manufacturer and designer. We constantly strive to improve our processes to ensure the highest quality products and services.

CUSTOM SOLUTIONS

Our team of electrical and mechanical engineers can design and develop the solution that best fits your needs.
